

Cool Video

Product Gallery Videos and Autoplay

User guide - PrestaExpert edition

Version 1.4.9

6 September 2026

What Cool Video does

Cool Video adds externally hosted videos to the same gallery that already contains product images. Paste a supported URL in the product editor, choose the gallery position and decide whether the video is active, starts muted or appears on product listings.

- Supports YouTube, Vimeo and Dailymotion URLs.
- Allows multiple videos on one product.
- Orders photos and videos in one shared gallery sequence.
- Supports optional muted autoplay and listing display.
- Includes adapters for Classic and Hummingbird plus a standard-hook fallback.

6. Troubleshooting
7. FAQ, uninstall and support

01 Paste URL	02 Choose position	03 Set options	04 Check storefront
-----------------	-----------------------	-------------------	------------------------

1. Requirements and compatibility

Use the versions required by your installed PrestaShop release. The module does not require Composer, cron or an external API key. This direct-sale edition requires a licence key assigned to the shop domain and validates it through prestaexpert.pl.

PrestaShop	1.7.x, 8.x and 9.x
PHP	The version supported by the installed PrestaShop release; module syntax is PHP 5.6+ compatible
Database	MySQL or MariaDB supported by the installed PrestaShop release
Themes	Classic, Hummingbird and compatible custom themes with standard product hooks
Browsers	Current desktop and mobile browsers with JavaScript enabled
External access	The visitor must be able to reach the selected video provider's thumbnail and player domains
Core overrides	None

2. Installation and upgrade

- 1 Sign in to the PrestaShop back office with permission to manage modules.
- 2 Open Module Manager and select Upload a module.
- 3 Choose the coolvideo.zip archive downloaded after purchase from prestaexpert.pl.
- 4 Wait for the successful installation message.
- 5 Open the module configuration, enter the activation code supplied with the purchase and verify the displayed shop domain.
- 6 Open a product, go to its Modules section and locate Product videos.

PrestaExpert licence

Cool Video is sold exclusively through prestaexpert.pl and is not distributed through PrestaShop Marketplace. Purchases, licence delivery and support are handled by Netteria.NET. A valid licence key is assigned to the shop domain and checked through the PrestaExpert licensing service. The module source code is provided under AFL-3.0; see LICENSE.txt for the complete licence text.

Updating an earlier PrestaExpert edition

- 1 Create a database and file backup according to your normal maintenance process.
- 2 Upload the newer coolvideo.zip through Module Manager.
- 3 Let PrestaShop run the module upgrade.
- 4 Clear the shop cache if the storefront still serves older CSS or JavaScript.
- 5 Open a product with videos and verify the gallery. Existing assignments are preserved.

3. Adding and managing videos

Add a video

- 1 Open the product you want to edit.
- 2 In the Modules section, find Product videos.
- 3 Paste a public YouTube, Vimeo or Dailymotion URL into Video URL.
- 4 Select Add video. The service, video identifier and thumbnail are detected automatically.
- 5 Save or update the options described below.

Gallery position	A number from 1 to 10000 in the shared photo-and-video sequence. Position 1 becomes the initial gallery item.
Active	Shows or hides this video without deleting its saved assignment.
Autoplay (muted)	Starts the selected video automatically without sound when its gallery item becomes active.
Show on product listings	Shows an eligible video on product cards. The video must also be active and assigned to position 1.
Delete	Permanently removes the selected product-video assignment.

How gallery positions work

Positions count all media, not videos alone. If a product has three images and a video is assigned to position 2, the expected order is image 1, video, image 2, image 3. A position greater than the current number of media items places the video at the end.

4. Storefront behaviour and theme integration

Product page

Active videos are inserted into the media gallery according to their saved positions. Visitors can move between images and videos through the gallery controls.

Initial media

When a video is assigned to position 1, it can replace the cover image as the first active gallery item.

Enlarged gallery

On supported Classic and Hummingbird layouts, videos are also available in the native enlarged media view.

Product listings

Only an active video at position 1 is eligible for listing display. The separate listing option must also be enabled.

Responsive display

Players and thumbnails adapt to the available gallery width on desktop, tablet and mobile.

Custom themes

If no dedicated adapter matches, the module uses standard product hooks to render a fallback video gallery. Highly customised themes may require compatibility work by the theme author.

01 Paste URL	02 Choose position	03 Set options	04 Check storefront
-----------------	-----------------------	-------------------	------------------------

5. External services and privacy

The module stores the video URL, provider, identifier, thumbnail URL, display options and product assignment in its own database table. It does not create customer profiles and does not send order, customer or back-office data to the module author.

- A visitor's browser may contact the selected video service to load a thumbnail or embedded player.
- The YouTube player uses the youtube-nocookie.com embed domain, but the merchant must still assess the complete storefront consent flow.
- Vimeo and Dailymotion players are delivered by their respective external domains.
- The merchant is responsible for consent settings, privacy notices and compliance with local law and the provider's terms.
- If external media is blocked by a consent tool, allow the required provider domains only after the appropriate consent state.

6. Troubleshooting

The URL is rejected	Confirm that it is a valid public HTTP or HTTPS URL from YouTube, Vimeo or Dailymotion. Remove unsupported redirect or playlist-only URLs.
The thumbnail is blank	Open the video on the provider, confirm it is public and verify that the visitor's network or consent tool allows the thumbnail domain.
The video does not play	Confirm that embedding is allowed for the video and that the player domain is not blocked by Content Security Policy, consent software or a browser extension.
Autoplay does not start	Autoplay policies differ by browser. Cool Video requests muted autoplay, but power-saving, accessibility or browser settings may still prevent it.
The video is absent from listings	Enable Active and Show on product listings, then set Gallery position to 1. Clear page and performance caches.
The order looks incorrect	Remember that positions include both photos and videos. Save the new number, clear cache and reload the product page.
A custom theme shows a fallback	The theme structure did not match the Classic or Hummingbird adapter. Verify that standard product hooks are present or ask the theme author about integration.

7. FAQ, uninstall and support

Can I add several videos to one product?

Yes. Each video has its own position, active state, autoplay option and listing option.

Can I upload a video file directly?

No. Cool Video embeds videos hosted on YouTube, Vimeo or Dailymotion.

Does autoplay include sound?

No. Autoplay is always requested in muted mode to follow common browser policies and avoid unexpected audio.

Can every video appear on product listings?

A product card represents the first gallery item, so listing display is available only to an active video assigned to position 1.

Does the module modify core files?

No. It uses its own database table, hooks, assets and controllers. It installs no core override.

What happens when a product is deleted?

Its saved Cool Video assignments are removed automatically.

What happens when the module is uninstalled?

The module's own product-video table and all saved assignments are deleted. Back up the database first if you may need the data later.

Uninstall

- 1 Open Module Manager and find Cool Video.
- 2 Select Uninstall and confirm the warning.
- 3 The module removes its administration tab and its own product-video table.

Support through prestaexpert.pl

Use the support channel associated with your purchase at prestaexpert.pl. Include the order number, PrestaShop, PHP and Cool Video versions, the theme name, the affected page type and reproducible steps. Never send customer personal data or live credentials.
