Cool Video customer documentation

Item	Details
Product	Cool Video: Product Gallery Videos and Autoplay
Edition	Direct-sale Netteria License edition 1.4.10
Seller and support channel	prestaexpert.pl
Publisher	Netteria.NET
Documentation revision	1.0, 12 September 2026

This documentation covers the licensed package purchased from prestaexpert.pl. Marketplace or development packages may not display the license activation screen, although the core video-management workflow is the same.

What Cool Video does

Cool Video lets a merchant add externally hosted videos to a PrestaShop product gallery without editing theme templates or pasting embed code. The module:

- recognizes supported YouTube, Vimeo, and Dailymotion URLs;
- creates a video thumbnail and inserts it among the product images;
- supports multiple videos for one product;
- lets the merchant enable or hide each video;
- can attempt muted autoplay when a video becomes the active gallery item;
- can expose the position-1 video on category, search, and other product listing cards;
- integrates directly with Classic and Hummingbird galleries and provides a separate fallback for compatible custom themes; and
- displays responsive players on desktop, tablet, and mobile layouts.

Videos remain hosted by their providers. The module stores the URL, provider, video identifier, generated thumbnail URL, position, and display options. It does not copy the video file to the shop server.

Documentation set

Document	Use it for
Installation and activation	Requirements, installation, license activation, updating, and removal
User guide	Adding videos, supported URL formats, positions, autoplay, and product listings
Troubleshooting	License, URL, gallery, thumbnail, autoplay, listing, and theme problems
Technical reference	Hooks, storage, endpoints, external hosts, security, privacy, and operational limits

Five-minute setup

1. Download the licensed Cool Video ZIP package supplied after purchase from prestaexpert.pl.
2. In the PrestaShop back office, open Modules > Module Manager, select Upload a module, and upload the ZIP file without unpacking it.
3. Open Configure for Cool Video, paste the activation code received after purchase, and select Activate license.
4. Confirm that License active is displayed and that Shop domain is the domain assigned to the key.
5. Open Catalog > Products, edit a saved product, and find Cool Video in the product's Modules section.
6. Paste a supported public video URL and select Add video.
7. Set Gallery position, Active, Autoplay (muted), and Show on product listings as required.
8. Check the product page on desktop and mobile. If listing display is enabled, also check a category or search page.

Important facts before you begin

- Supported providers in version 1.4.10 are YouTube, Vimeo, and Dailymotion.
- Direct MP4 URLs, uploaded video files, playlists, channels, and provider pages that do not identify one video are not supported.
- A newly created product must be saved once before Cool Video can attach a video to it.
- Gallery positions include both images and videos and start at 1.
- To show a video on product listings, make it active, enable the listing option, and set its gallery position to 1.
- Manual selection starts playback even when the autoplay option is disabled. The autoplay option controls automatic playback when the video becomes the initial or active gallery item.
- Browser and provider policies can still prevent autoplay. Cool Video requests muted playback to comply with common browser rules.
- Never uninstall the module as an update method. Uninstallation deletes the database table containing all product-video assignments.

Getting support

Use the official [Cool Video product page](#) for purchase, license, update, and support information.

When reporting a problem, include the Cool Video version, PrestaShop version, PHP version, theme name and version, affected product URL, exact steps, and a screenshot. For license issues, include the displayed shop domain and masked key only. Never send the complete activation key in a public message.

Installation and activation

This guide covers the Cool Video direct-sale Netteria License edition 1.4.10 supplied through prestaexpert.pl.

Requirements

Requirement	Details
PrestaShop	1.7.x, 8.x, or 9.x
PHP and database	A PHP and MySQL or MariaDB combination supported by the installed PrestaShop version
PHP extension	cURL is required for license activation and validation
Network	The shop server must be able to make outbound HTTPS requests to prestaexpert.pl
Browser	A current browser with JavaScript and <code>fetch</code> support is recommended for back-office management and listing videos
Theme	Classic and Hummingbird are integrated directly; compatible custom themes can use the standard-hook fallback
Permissions	A back-office employee account allowed to install modules and edit products
License	A Cool Video activation key assigned to the shop domain used during purchase

Before installing on a production shop, create a current backup of the shop files and database. Testing the installation on a staging copy is recommended when the shop uses a heavily customized theme, strict Content Security Policy, or aggressive JavaScript optimization.

Download the correct package

Download the licensed package delivered after purchase from the official [Cool Video product page](#). The filename may be `coolvideo-1.4.10-netteria-license.zip` or a delivery name such as `coolvideo.zip`.

Do not unpack and re-compress the archive. The ZIP must contain a top-level `coolvideo` directory with `coolvideo.php` inside it. A double-wrapped archive, for example `coolvideo/coolvideo/coolvideo.php`, will not install correctly.

The repository may also contain Marketplace or development builds. Those are separate distributions and can have different activation behavior. Use the package supplied with the prestaexpert.pl purchase for this guide.

Install the module

1. Sign in to the PrestaShop back office with an account allowed to install modules.
2. Open Modules > Module Manager. On some PrestaShop 1.7 installations the menu label can appear as Modules and Services.
3. Select Upload a module.
4. Drop the supplied ZIP file into the upload area or choose it from disk.
5. Wait for PrestaShop to unpack and install the module.
6. Confirm that Cool Video is listed as installed and enabled.
7. Select Configure to open the license screen.

If installation fails, do not repeatedly upload different archives. First verify the ZIP structure, writable permissions for the PrestaShop **modules** directory, PHP upload limits, available disk space, and the PrestaShop log.

Activate the direct-sale license

1. Open Modules > Module Manager and find Cool Video Product - Netteria License.
2. Select Configure.
3. Read the Shop domain displayed in the license status panel.
4. Confirm that this domain is the one assigned to the key during purchase. The validator compares host names without protocol, port, path, or a leading **www**..
5. Paste the activation code into License key.
6. Select Activate license.
7. Confirm that the page displays License active. The saved key is shown in masked form. If the license has an expiry date, the page also displays it.

The key permits only letters, numbers, and hyphens and can contain up to 120 characters. Keep it private. Do not send the complete key in screenshots, tickets, public repositories, or browser-console output.

How validation behaves

- A successful result is cached for 24 hours.
- An invalid result or temporary connection failure is retried after 5 minutes.
- After at least one successful online validation, a temporary licensing-server outage can use the most recent valid confirmation for up to 7 days.
- A key that has never been validated online cannot use the offline grace period.
- If the license is inactive, video management is blocked and front-office gallery and listing output is not rendered.

The server-side validation request is sent over HTTPS to:

```
https://prestaexpert.pl/modules/netterialicenseprovisioner/api/v1/validate.php
```

Allow outbound TCP port 443, DNS resolution, and trusted certificate validation for that host. The module needs PHP cURL for the request and should be able to write its status cache under **modules/coolvideo/cache/**.

Verify the installation

Complete this check before configuring many products:

1. Open a product that has already been saved and therefore has a product ID.
2. Find Cool Video in the product's Modules section.
3. Add one supported public URL, for example a standard YouTube watch URL.
4. Leave Active enabled and set Gallery position to 2.
5. Save the position if you changed it.
6. Open the public product page in a private browser window.

7. Confirm that the video thumbnail appears after the first product image and that selecting it starts the player.
8. Open the image or media modal and confirm that the video is available there.
9. Check the same page at a mobile width.
10. If product-list display is needed, set the video to position 1, enable Show on product listings, and verify a category or search page.

Update without losing assignments

Use an in-place module update. Do not uninstall the old version first because uninstallation removes the table containing every product-video assignment.

1. Back up the shop files and database.
2. Record the installed Cool Video version and confirm that the license is active.
3. Obtain the new licensed ZIP from the official purchase channel.
4. Use PrestaShop's module update or upload workflow to replace the module in place.
5. Let PrestaShop run the included upgrade scripts.
6. Confirm that the module remains enabled and that the license page reports an active license.
7. Clear the PrestaShop cache. If CCC or another optimization system combines CSS and JavaScript, clear that cache as well.
8. Open a product with existing videos and confirm that its assignments, positions, and options remain present.
9. Test the product gallery, native media modal, mobile layout, and a product listing page.

The upgrade to the direct-sale 1.4.10 edition is designed to preserve existing video assignments. A backup remains essential because server configuration, third-party optimizers, and interrupted updates are outside the module's control.

Domain changes and multistore

The direct-sale license is bound to the normalized shop domain. Changing the PrestaShop shop URL, moving from a staging host to production, or adding another domain can cause Domain mismatch until the license assignment is updated. Use the official product and support channel to confirm the licensing terms and request a domain change when required.

In a multistore installation, switch to the intended shop context before opening the license screen and verify the domain shown for each storefront. Do not assume that one key covers every independent domain.

Disable or uninstall

Disabling the module stops its back-office video manager and front-office output but normally leaves saved assignments in the database. Re-enabling the module and restoring a valid license makes them available again.

Uninstalling is destructive:

- all product-video assignments are deleted;
- the module database table is removed;
- the stored Cool Video activation key and local license-status cache are removed; and

- the hidden administration tab used by the video manager is removed.

Export or back up the database before uninstalling if the assignments may be needed later. PrestaShop does not provide an undo operation for the removal.

Next step

Continue with the [User guide](#) to add videos and configure their gallery, autoplay, and listing behavior.

User guide

This guide explains how to manage Cool Video after the direct-sale package has been installed and activated. For setup requirements, see [Installation and activation](#).

Open the video manager

1. Sign in to the PrestaShop back office.
2. Open Catalog > Products.
3. Edit the required product.
4. If this is a new product, save it once so that PrestaShop assigns a product ID, then reopen or refresh the editor.
5. Open the product's Modules section and locate Cool Video.

The exact placement of the Modules section varies slightly between PrestaShop 1.7, 8, and 9. If the manager displays a license warning instead of the URL field, open the module configuration and activate the license first.

Supported video URLs

Cool Video version 1.4.10 accepts one public video URL from one of the following providers.

Provider	Supported examples
YouTube	https://www.youtube.com/watch?v=VIDEO_ID
YouTube short link	https://youtu.be/VIDEO_ID
YouTube embed	https://www.youtube.com/embed/VIDEO_ID
YouTube Shorts	https://www.youtube.com/shorts/VIDEO_ID
YouTube Live	https://www.youtube.com/live/VIDEO_ID
Vimeo	https://vimeo.com/123456789
Vimeo player	https://player.vimeo.com/video/123456789
Dailymotion	https://www.dailymotion.com/video/VIDEO_ID
Dailymotion embed	https://www.dailymotion.com/embed/video/VIDEO_ID
Dailymotion short link	https://dai.ly/VIDEO_ID

Mobile YouTube watch URLs from m.youtube.com and YouTube Music watch URLs from music.youtube.com are also recognized. Use the direct URL for a single video.

The following are not supported in version 1.4.10:

- direct MP4, MOV, WebM, or other video-file URLs;
- uploading a local video file to PrestaShop;
- YouTube playlists, channels, search results, or URLs without a video ID;
- generic Vimeo profile, showcase, or collection pages;
- generic Dailymotion channel or playlist pages; and
- unsupported redirect or tracking links that do not expose the provider's video ID in a recognized format.

The source video must permit embedding and must be available to the visitors who will view it. Private, deleted, age-restricted, region-restricted, or embedding-disabled videos can produce a valid thumbnail but refuse playback.

Add a video

1. Copy the public page URL for one supported video.
2. Paste it into Video URL in the Cool Video panel.
3. Select Add video.
4. Wait for the success notification and page refresh.
5. Confirm that a video card appears with a thumbnail, provider name, generated title, and provider video ID.

Cool Video derives the provider, ID, embed URL, and thumbnail URL from the address. In version 1.4.10 the generated title and description are not edited from the product panel.

New videos use these defaults:

Setting	Default
Gallery position	The next position after the product's existing Cool Video entries
Active	Enabled
Autoplay (muted)	Disabled
Show on product listings	Disabled
Player ratio	Responsive 16:9 embed inside the Classic and fallback players

Understand the video card

Control	Effect	Save behavior
Gallery position	Places the video among product images and other videos	Select Save position after entering a whole number from 1 to 10000
Active	Shows or hides the video in front-office output	Saved immediately when toggled
Autoplay (muted)	Requests muted automatic playback when this video becomes the initial or active gallery item	Saved immediately when toggled
Show on product listings	Allows the position-1 video to appear on recognized product cards	Saved immediately when toggled
Delete	Permanently removes the assignment from this product	Requires confirmation and has no undo

If a toggle cannot be saved, the control returns to its previous value and the back office displays an error notification.

Set the gallery position

Positions are shared by product images and videos and begin at **1**.

For a product with three images named A, B, and C:

Video position	Resulting order
1	Video, Image A, Image B, Image C
2	Image A, Video, Image B, Image C
3	Image A, Image B, Video, Image C
4 or higher	Image A, Image B, Image C, Video

On Classic and Hummingbird, the video is inserted into the combined media order. A position-1 video becomes the initial gallery item when the product page opens. On a custom theme that uses the generic fallback, videos appear as a separate thumbnail row near the gallery, so an exact position among images may not be available.

Use a unique position for every video when predictable ordering matters. If several videos use the same position, their internal creation order resolves the tie and may not match the order expected by a merchant.

Active and inactive videos

Keep Active enabled to render the video in the gallery, native media modal, Videos extra-content tab, generic fallback, and eligible product listing card.

Disable Active to hide the video without deleting its assignment. The URL, position, and options remain stored and can be restored later by enabling the control again.

Deleting a video is different from disabling it. Delete removes the row from the database and cannot be undone from the module interface.

Autoplay behavior

Autoplay (muted) tells Cool Video to request muted playback when the video becomes the initial or active gallery item. Muting is included because modern browsers normally block audible autoplay.

Important behavior:

- If a position-1 video has autoplay enabled, Cool Video attempts to start it when the gallery opens on that video.
- Selecting a video thumbnail manually starts playback even when the autoplay option is disabled.
- Opening a listing video or modal manually also starts playback.
- A browser, device, privacy extension, consent tool, or video provider can still block autoplay.
- Cool Video does not force sound on. Visitors can use the provider player to unmute after playback begins.

For the least intrusive storefront experience, leave autoplay disabled unless the product presentation clearly benefits from it.

Show a video on product listings

The listing option can add a video thumbnail or cover button to recognized product cards on category, search, and other listing pages. Selecting that button opens a responsive video modal and starts the video.

All three conditions are required:

1. Active is enabled.
2. Show on product listings is enabled.
3. Gallery position is exactly 1.

Only one qualifying video is returned for each product card. For predictable results, enable the listing option on one video per product and make that video the only video at position 1.

Depending on theme markup, the video control either covers the product image area or appears as a smaller control in its lower corner. If the control is not visible on a custom theme, see [Troubleshooting](#).

Front-office behavior by theme

Classic

- Video thumbnails are inserted into the standard thumbnail strip.
- Selecting a video replaces the main product image with a responsive player.
- Video entries are also inserted into the native product media modal.
- Selecting a normal product image removes the active video player and restores the image.

Hummingbird

- Video slides and thumbnails are inserted into the product carousel.
- The active media item and provider player are synchronized with the carousel.
- The native media modal receives the same ordered image and video items.

Compatible custom themes

Cool Video first looks for known Classic and Hummingbird structures. If neither is available, it uses standard product hooks to place a separate row of video buttons near the product gallery. Selecting a button opens Cool Video's own responsive modal. Highly customized themes that omit the standard hooks or use unrecognized product-card markup may need theme-specific integration.

Videos extra-content tab

When the theme displays PrestaShop product extra content, active videos are also available in a Videos tab or section. This provides an additional access path even when the gallery adapter is limited by theme markup.

Manage multiple videos

You can add multiple supported videos to one product. A practical sequence is:

1. Put the most important product demonstration first.
2. Add installation, sizing, care, or comparison videos later in the gallery.
3. Give each video a unique position.
4. Enable listing display only for the single position-1 video.

5. Disable outdated content before deleting it so the storefront can be checked safely.
6. Verify desktop, mobile, and modal behavior after changing several positions.

There is no drag-and-drop sorter in version 1.4.10. Enter each numeric position and select Save position on that video card.

Performance, privacy, and consent

Product pages load provider thumbnails before a visitor starts a video. The provider iframe is created when needed by the gallery or modal, while the extra-content tab uses lazy-loaded iframes. Listing pages request eligible video metadata from the same shop and add controls only to recognized product cards.

Video playback and thumbnails make network requests to third-party provider domains. Review the shop's privacy notice, cookie-consent configuration, and Content Security Policy. YouTube playback uses the [youtube-nocookie.com](https://www.youtube-nocookie.com) embed domain, but this does not remove every privacy or consent obligation.

Remove a video

1. Open the product's Cool Video panel.
2. Find the correct provider, thumbnail, and video ID.
3. If uncertain, disable Active and check the storefront first.
4. Select Delete.
5. Confirm the prompt.
6. Verify the product page and listing page.

Removal affects only the PrestaShop assignment. It does not delete the original video from YouTube, Vimeo, or Dailymotion.

Troubleshooting

Use this guide for the Cool Video direct-sale Netteria License edition 1.4.10. Start with the quick checks, then use the symptom-specific sections.

Quick diagnostic checklist

1. Confirm that Cool Video is installed and enabled in Modules > Module Manager.
2. Open Configure and confirm License active for the displayed shop domain.
3. Confirm that the affected product has been saved and has a product ID.
4. Confirm that the video is Active and uses a supported public URL.
5. Open the provider URL directly in a private browser window and confirm that the video exists and permits embedding.
6. Clear the PrestaShop cache and any CCC, reverse-proxy, CDN, or full-page cache involved in the storefront.
7. Test without browser extensions and accept the shop's media or marketing consent category if a consent manager blocks external players.
8. Check both desktop and mobile layouts.

9. If a custom theme is used, temporarily test with its default gallery configuration or the Classic theme on a staging shop.
10. Review the browser console, failed network requests, PrestaShop logs, and web-server or PHP logs.

Symptom reference

Symptom	Most likely cause	First action
Cool Video is absent from the product editor	Product not saved, module disabled, license inactive, or employee lacks access	Save the product, confirm module and license status, then check permissions
Invalid or unsupported video URL	URL is not one of the recognized single-video formats	Copy a direct YouTube, Vimeo, or Dailymotion video URL from the supported list
Thumbnail is blank or broken	Thumbnail host is blocked, video is unavailable, or Content Security Policy rejects the image	Open the thumbnail host in browser network tools and update CSP or firewall rules
Thumbnail appears but playback fails	Provider disabled embedding, video is private or restricted, or iframe host is blocked	Test the provider's embed URL and video privacy settings
Video is missing from the gallery	Video inactive, stale cache, inactive license, missing theme hook, or JavaScript conflict	Enable the video, clear caches, verify license, and inspect the browser console
Gallery position is ignored	Generic theme fallback is active or cached gallery markup is stale	Clear caches and check whether the page uses the Classic, Hummingbird, or generic adapter
Listing video is missing	Video is not active, listing option is off, or position is not 1	Enable both options and save gallery position 1
Autoplay does not start	Browser, provider, consent, battery, or data-saving policy blocked it	Confirm muted autoplay is enabled and test after explicit user interaction
Changes do not appear	PrestaShop, CCC, CDN, service worker, or page cache is stale	Purge all relevant caches and hard-refresh the page
Everything disappeared after update	Module became disabled, hooks were not restored, license is inactive, or old assets remain cached	Enable the module, verify license, clear caches, and check required hook registrations

License activation problems

Missing license key

Open the module configuration, paste the activation code supplied with the prestaexpert.pl purchase, and select Activate license. Use the licensed direct-sale package, not a Marketplace or development archive.

License not found

Check every character in the key. Remove leading and trailing spaces and make sure the key belongs to Cool Video. If the key still fails, use the official [product support channel](#).

Domain mismatch

Compare Shop domain on the module configuration page with the domain used for the purchase. The validator ignores protocol, port, path, and a leading **www.**, but a different host or subdomain is still a different domain.

Check Shop Parameters > Traffic & SEO > Set shop URL or the equivalent PrestaShop shop-URL settings. In multistore, switch to the intended shop context before checking. Contact the official sales channel when the licensed domain must be changed.

License expired

Review Valid until on the configuration screen and renew or correct the license through the official sales channel. Do not change the server clock to work around the status.

Licensing server unavailable

Check the following on the shop server:

- PHP cURL is enabled for the web PHP runtime, not only for command-line PHP;
- DNS resolves `prestaexpert.pl`;
- outbound HTTPS on TCP port 443 is allowed;
- TLS certificate verification works and the server has a current CA bundle;
- the server date and time are correct; and
- no proxy, WAF, or hosting firewall rewrites or blocks the request.

The validation endpoint is:

```
https://prestaexpert.pl/modules/netterialicenseprovisioner/api/v1/validate.php
```

After a prior successful check, the module can use the last valid confirmation for up to 7 days during a temporary outage. It retries temporary failures after 5 minutes. A key that has never been confirmed cannot activate offline.

License works briefly but is checked too often

Confirm that `modules/coolvideo/cache/` exists and is writable by the PHP or web server account. Do not make the entire module directory world-writable. Use the least permissions required by the hosting environment.

The video manager is missing

The module needs an existing product ID. Save a new product once, then refresh or reopen the product editor.

If an existing product still has no Cool Video panel:

1. Confirm that the module is enabled in the current shop context.
2. Confirm that the license is active.
3. Confirm that the employee profile can edit products and access the module's hidden administration controller.
4. Clear the back-office cache and hard-refresh the page.
5. Check that the module is registered on `displayAdminProductsExtra` and `displayBackOfficeHeader`.
6. Review PrestaShop and PHP logs for errors from `coolvideo`.

A URL is rejected

Use a full `http://` or `https://` URL, preferably HTTPS. The URL must point to one video and contain an ID in a recognized location.

Try a canonical format:

```
https://www.youtube.com/watch?v=VIDEO_ID
https://vimeo.com/123456789
https://www.dailymotion.com/video/VIDEO_ID
```

Do not use a direct MP4 URL, playlist, channel, search result, or link-shortener URL other than **youtu.be** or **dai.ly**. Remove extra text copied before or after the URL. If a provider-generated share link redirects, open it in a browser and copy the final canonical video URL.

Thumbnail problems

Cool Video generates remote thumbnail addresses. It does not download and store the image locally.

Check access to the relevant host:

Provider	Thumbnail host
YouTube	img.youtube.com
Vimeo	vumbnail.com
Dailymotion	www.dailymotion.com

A strict Content Security Policy must allow these hosts in **img-src**. Privacy filters, ad blockers, DNS filtering, or a regional block can also hide a thumbnail. Confirm that the video itself still exists.

Playback problems

Open the video's provider page and verify that it is public, available in the visitor's region, and allowed to play in an embedded iframe. Provider-level privacy, age, ownership, or embedding restrictions cannot be overridden by Cool Video.

A strict Content Security Policy must allow the relevant player host in **frame-src**:

```
https://www.youtube-nocookie.com
https://player.vimeo.com
https://www.dailymotion.com
```

Also check cookie-consent tools. Some tools intentionally block third-party iframes until the visitor accepts a media or marketing category. Configure the consent tool to replace or release the Cool Video iframe after consent.

Gallery or modal problems

1. Confirm that the video is active.
2. Clear PrestaShop and asset-combination caches.
3. Disable JavaScript delay, defer, or optimization features temporarily on a staging shop.
4. Check for browser-console errors before and after selecting the video.
5. Inspect whether the page contains a Classic gallery, Hummingbird product carousel, or a **data-coolvideo-mount** fallback point.
6. Confirm that the theme renders at least one standard product hook used by the module.
7. Test the theme's original gallery without overrides or page-builder changes.

Cool Video can render a generic row of video buttons when it cannot integrate with a known gallery. In that mode, videos open in a separate responsive modal and their numeric position cannot interleave them precisely among image thumbnails.

Product listing problems

For every affected product, confirm all of the following:

- the video is active;
- Show on product listings is enabled;
- the saved gallery position is exactly **1**;
- only one listing video is configured at position **1** for predictable output;
- the page is a listing page, not a product detail page;
- JavaScript and **fetch** are available;
- the product card exposes **data-id-product** or supported product-card markup; and
- the same-origin listing endpoint is not blocked by a cache, WAF, or security rule.

The module requests at most 100 unique product IDs per listing request. Custom infinite-scroll or page-builder markup can require theme-specific integration.

Autoplay problems

Autoplay is a request, not a guarantee. Confirm that Autoplay (muted) is enabled and that the video is the initial or active item. Test in a private window with browser extensions disabled.

Browsers and devices can block autoplay because of user preferences, power or data-saving modes, prior interaction rules, iframe permissions, or provider policy. Manual selection should still start playback. Cool Video always requests muted autoplay; visitors can unmute in the provider player.

Changes are not visible

Purge caches in this order:

- 1.** PrestaShop cache from Advanced Parameters > Performance.
- 2.** CSS and JavaScript CCC cache.
- 3.** Theme or page-builder cache.
- 4.** Reverse-proxy or hosting cache.
- 5.** CDN cache.
- 6.** Browser cache, followed by a hard refresh.

If a service worker is installed, update or unregister it on the test browser. Confirm that the page loads the current Cool Video CSS and JavaScript version.

Prepare a useful support report

Include:

- Cool Video version and package edition;
- PrestaShop version;
- PHP version and whether web PHP has cURL enabled;

- theme name, theme version, and page builder if used;
- affected product and listing URLs;
- provider and exact video URL;
- expected result and actual result;
- exact steps to reproduce;
- desktop or mobile device and browser version;
- relevant browser-console and network errors;
- relevant PrestaShop, PHP, and web-server log entries; and
- screenshot or short screen recording.

For activation issues, include the displayed normalized shop domain, license state, error code or message, and masked license key. Never include the complete activation key or back-office credentials.

Technical reference

This reference documents the Cool Video direct-sale Netteria License edition 1.4.10 sold through prestaexpert.pl. It is intended for shop administrators, integrators, hosting providers, and support technicians.

Module identity

Property	Value
Technical name	<code>coolvideo</code>
Direct-sale version	<code>1.4.10</code>
Display name	Cool Video Product - Netteria License
Publisher	Netteria.NET
Product and sales channel	prestaexpert.pl
PrestaShop compatibility	1.7.x, 8.x, and 9.x
Primary function	Add YouTube, Vimeo, and Dailymotion videos to product galleries and eligible product listing cards
Theme strategy	Native Classic adapter, native Hummingbird adapter, then standard-hook generic fallback
Local video upload	Not supported in version 1.4.10

The repository also includes Marketplace and development distributions. Their activation rules can differ. This reference applies to the domain-bound direct-sale package.

Runtime requirements

- PHP and MySQL or MariaDB versions supported by the installed PrestaShop release.
- PHP cURL for direct-sale license validation.
- Server-side outbound HTTPS access to prestaexpert.pl.
- A writable module cache directory for efficient license-status caching.

- Front-office JavaScript and a browser with **fetch** for listing-page metadata.
- A theme that uses Classic, Hummingbird, or standard PrestaShop product hooks.

The module does not require jQuery for its front-office adapter and does not add PrestaShop class overrides.

Stored data

Installation creates the following table, where **{prefix}** is the configured PrestaShop database prefix:

```
{prefix}coolvideo_product_video
```

Each assignment stores:

Field	Purpose
Product ID	Associates the row with one PrestaShop product
Original URL	Preserves the URL entered by the merchant
Provider and video ID	Identifies YouTube, Vimeo, or Dailymotion content
Generated title and description	Supplies accessible player labeling and optional text output
Thumbnail URL	Points to the provider-specific remote thumbnail
Position	Orders the video among product media, starting at 1
Active	Controls all front-office visibility
Autostart	Requests muted autoplay for an active gallery video
Show in listing	Permits position-1 listing output
Width and height	Stores legacy embed dimensions; responsive layouts control the visible player
Created and updated timestamps	Records assignment lifecycle dates

Rows are read in ascending position and then ascending internal video-row ID. Product deletion removes the associated Cool Video rows. Module uninstallation removes the complete table.

Supported URL parsing

The parser accepts only **http** and **https** URLs no longer than 500 characters. Provider and video IDs are extracted as follows.

Provider	Accepted hosts and paths	ID validation
YouTube	<code>youtu.be/{id}</code> ; <code>youtube.com/watch?v={id}</code> ; <code>/embed/{id}</code> ; <code>/shorts/{id}</code> ; <code>/live/{id}</code> ; mobile and music watch hosts	6 to 20 letters, digits, underscores, or hyphens
Vimeo	<code>vimeo.com/{numeric-id}</code> and <code>player.vimeo.com/video/{numeric-id}</code>	1 to 20 digits
Dailymotion	<code>dai.ly/{id}</code> ; <code>dailymotion.com/video/{id}</code> ; <code>/embed/video/{id}</code> ; supported geo host	4 to 20 letters or digits

Query-string start times and other non-ID parameters are not preserved in the generated embed URL. Direct files and other providers are rejected.

Generated external URLs

Purpose	Host or URL pattern
YouTube player	<code>https://www.youtube-nocookie.com/embed/{id}?rel=0</code>
YouTube thumbnail	<code>https://img.youtube.com/vi/{id}/hqdefault.jpg</code>
Vimeo player	<code>https://player.vimeo.com/video/{id}</code>
Vimeo thumbnail	<code>https://vumbnail.com/{id}.jpg</code>
Dailymotion player	<code>https://www.dailymotion.com/embed/video/{id}</code>
Dailymotion thumbnail	<code>https://www.dailymotion.com/thumbnail/video/{id}</code>

Autoplay adds the provider-specific autoplay and mute query parameters. Every iframe allows autoplay, encrypted media, picture-in-picture, and fullscreen.

Registered hooks

Hook	Purpose
<code>displayBackOfficeHeader</code>	Loads product-video administration CSS and JavaScript
<code>displayAdminProductsExtra</code>	Renders the video manager in the product editor
<code>displayHeader</code>	Loads front assets and exposes product or listing configuration
<code>displayProductExtraContent</code>	Adds active videos to the standard Videos extra-content area
<code>displayAfterProductThumbs</code>	Supplies a hidden integration mount near product thumbnails
<code>displayFooterProduct</code>	Supplies a second standard-hook mount for broader theme compatibility
<code>actionObjectProductDeleteAfter</code>	Removes assignments after a product is deleted

The installation and upgrade routines attempt to register every required hook, even if one legacy hook fails, so a later retry can restore the complete state.

Back-office operations

The hidden `AdminCoolvideoProductVideo` controller serves same-origin AJAX operations for adding, deleting, toggling, and changing positions. Mutating requests must:

- use HTTP POST;
- pass normal PrestaShop administration authentication and token checks;
- be made by an employee profile with edit access;
- refer to a video owned by the supplied product ID; and
- pass active direct-sale license validation.

Input positions are integers from 1 through 10000. Provider URLs are parsed and validated server-side before a row is inserted.

Listing endpoint

The front controller exposes a read-only same-origin action similar to:

```
/module/coolvideo/ajax?ajax=1&action=GetListingVideos&product_ids=12,34,56
```

The endpoint:

- requires a valid direct-sale license;
- accepts no more than 100 unique positive product IDs;
- returns at most one qualifying row per product;
- returns only rows that are active, have listing display enabled, and use position **1**; and
- sends no-store cache headers because listing eligibility changes with gallery position.

The browser adapter observes dynamic product-card changes so it can reapply controls after faceted navigation or compatible infinite-scroll updates.

Gallery adapters

Classic adapter

The adapter locates the standard main and modal thumbnail lists, inserts video items into the combined media order, synchronizes thumbnail dimensions, and replaces the cover image with a responsive iframe when a video is selected.

Hummingbird adapter

The adapter creates video carousel slides and thumbnails, recalculates media indexes, synchronizes active slides, and extends the Bootstrap-based product media modal.

Generic adapter

When neither known structure is available, the module finds a standard hook mount or a recognized gallery anchor and renders a separate group of video buttons. These buttons use the module's accessible responsive modal. The generic adapter does not promise exact interleaving among theme image thumbnails.

Product listing adapter

Recognized product cards receive a button over the image area or a 72-pixel corner control, depending on available markup. Selecting it opens the module modal and requests playback. The listing adapter processes up to 100 product IDs in one request.

License implementation

The direct-sale edition stores its activation key under the PrestaShop configuration key:

```
NETTERIA_LICENSE_COOLVIDEO
```

Validation uses server-side HTTPS POST requests to:

```
https://prestaexpert.pl/modules/netterialicenseprovisioner/api/v1/validate.php
```

The request identifies the license key, normalized shop host, and technical module name. The normalized host is lowercase and excludes protocol, port, path, trailing dot, and a leading **www.**. Internationalized domains are converted to ASCII when the PHP internationalization function is available.

Cache behavior:

Result	Cache or retry interval
Valid	24 hours
Invalid	5 minutes
API unavailable	5 minutes
Offline grace after a prior valid check	Up to 7 days from the last online validation

Cache filenames include a hash of the API URL, module name, shop ID, domain, and license key. The plain key is not written to the JSON status cache. The license form displays a masked version of the configured key.

Content Security Policy

A restrictive policy should allow the exact provider hosts used by the shop. An illustrative policy fragment is:

```
frame-src 'self' https://www.youtube-nocookie.com https://player.vimeo.com https://www.dailymotion.com;
img-src 'self' data: https://img.youtube.com https://vumbnail.com https://www.dailymotion.com;
connect-src 'self';
```

Merge these hosts into the existing policy rather than copying this fragment as a complete policy. Server-side license validation is performed by PHP cURL and is controlled by the server firewall, not browser CSP.

Privacy and third-party services

The shop database stores the merchant-supplied URL and derived metadata, not the video content. Visitors can connect to provider thumbnail and player hosts. Those services can receive network metadata and can apply their own cookies, tracking, privacy, age, and regional rules.

Review the shop privacy notice and consent-manager configuration for the chosen providers. YouTube uses the privacy-enhanced **youtube-nocookie.com** player host, but compliance requirements still depend on jurisdiction and shop policy.

Lifecycle and recovery

- Disable: stops module output while normally preserving stored rows.
- Enable: restores output when the license and hooks are valid.
- Update in place: runs schema and recovery upgrades and preserves existing rows when the update completes successfully.
- Uninstall: deletes the assignment table, administration tab, activation configuration, and license cache.
- Delete product: removes rows associated with that product.

Back up the database before updates or uninstallation. Do not uninstall as an update procedure.

Operational limits and cautions

- One URL can identify only one supported provider video.
- URL length is limited to 500 characters.
- The administration position range is 1 through 10000.

- Listing lookup is limited to 100 unique product IDs per request.
- Only an active, listing-enabled position-1 video qualifies for a product card.
- The module does not verify in advance that a provider permits embedding.
- Remote thumbnail availability is controlled by the provider or thumbnail service.
- Browser autoplay remains subject to browser, device, consent, and provider policy.
- Custom themes can require selector or layout adaptation.

Support handoff

For an efficient technical handoff, provide version details, the affected URLs, theme and optimizer information, reproduction steps, console and network errors, relevant server logs, and the displayed license state. Mask credentials and activation keys.

Use the official [Cool Video product page](#) for licensed-package support, updates, and domain-assignment questions.
